

OVADO

Enhancing Data Validation for Safety-Critical Railway Systems

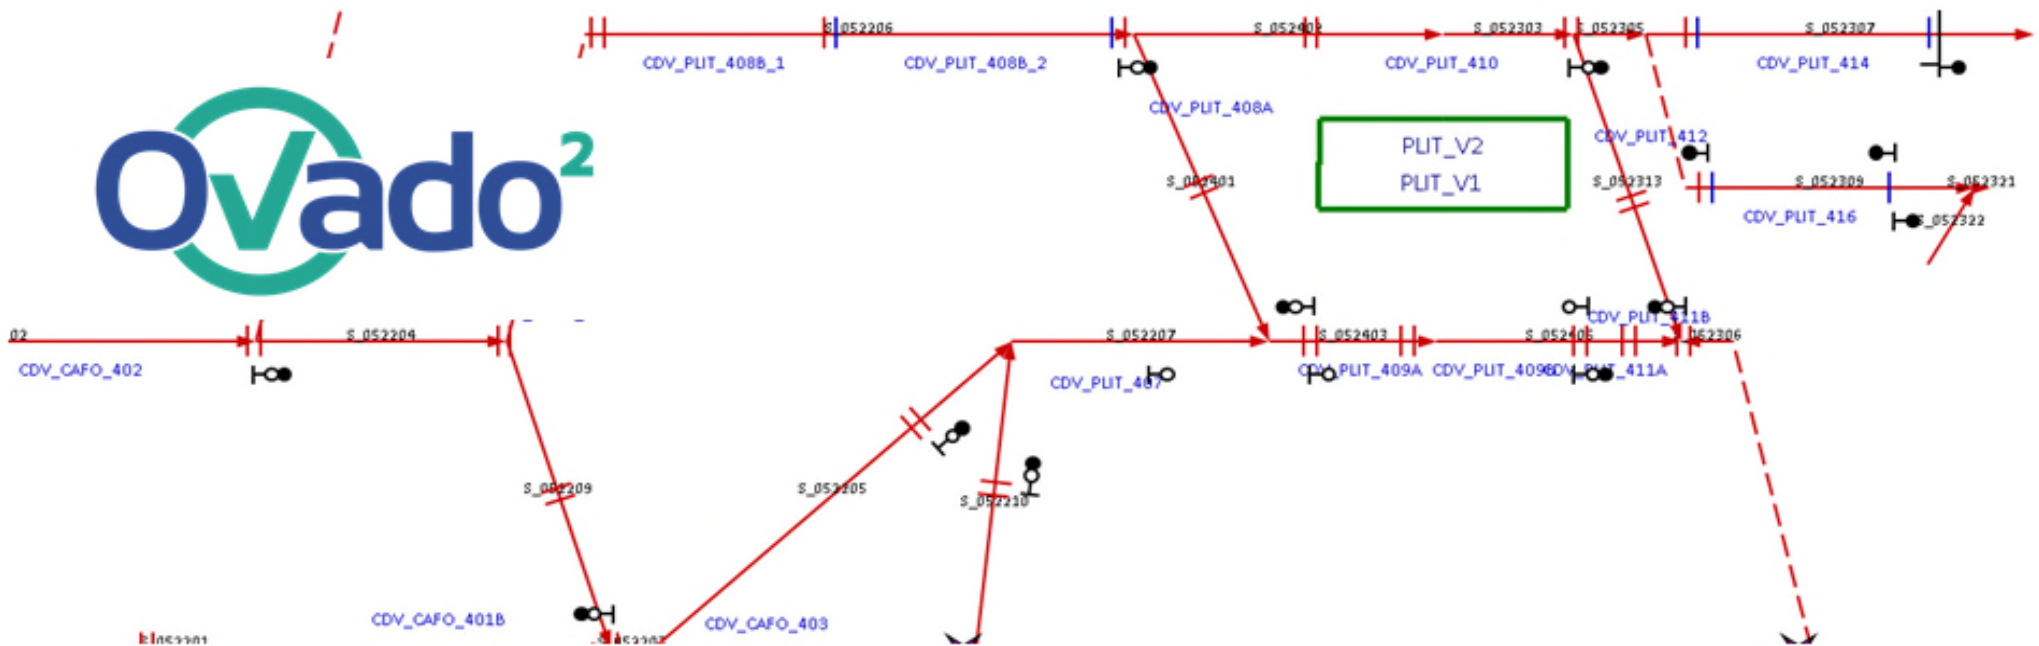

Pistoia, Italy

RATP – Software Assessment (RATP/ ING/STF/QS/AQL)

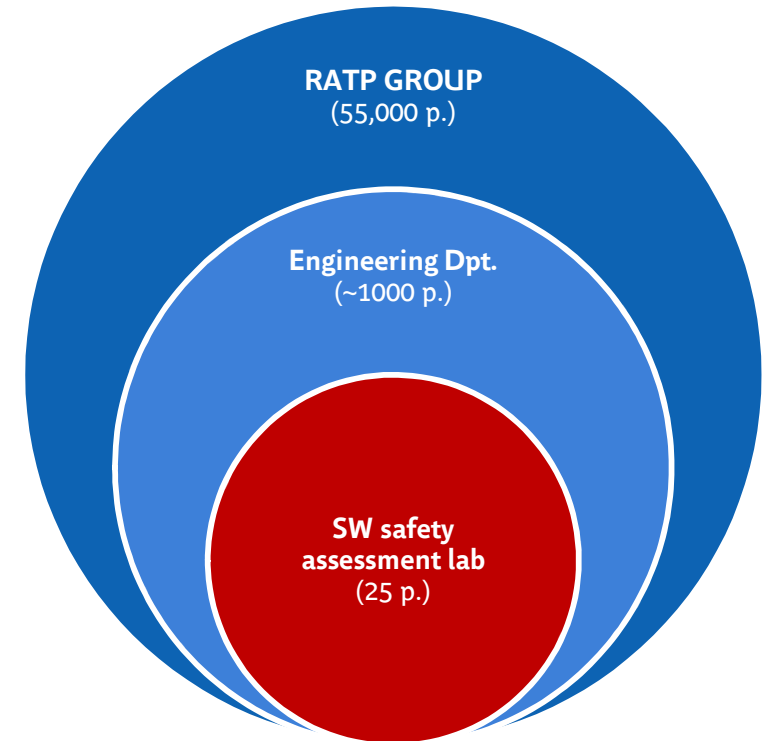

RSSRail 2017

Manel FREDJ, Sven Leger, Abderrahmane Feliachi and Julien Ordioni

November 15th, 2017

- AQL: RATP SW safety assessment lab
 - Internal assessment of safety critical software
 - Data validation
- CBTC configuration data
 - Line configuration and all objects on this line

What is OVADO?

- The tool
- Data validation process

Use cases

- Concrete cases : Metro line CBTC
- Emerging needs?

Enhancing data validation process

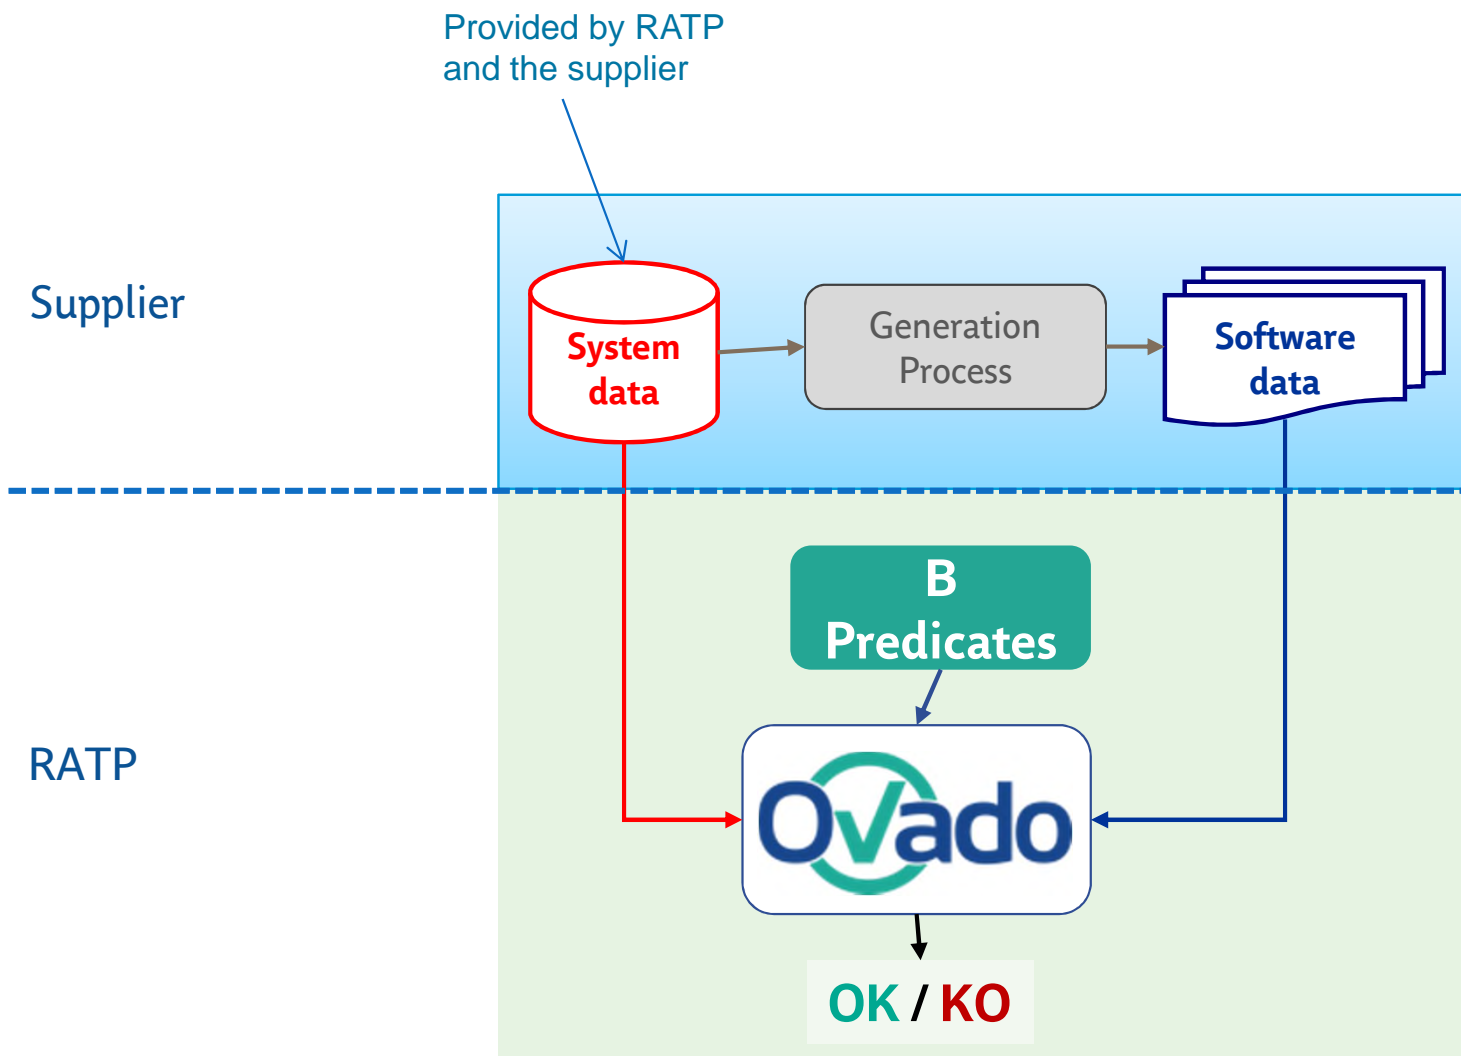

- Genericity
- B-OVADO editor
- Guidelines

Conclusion & future work

What is OVADO?

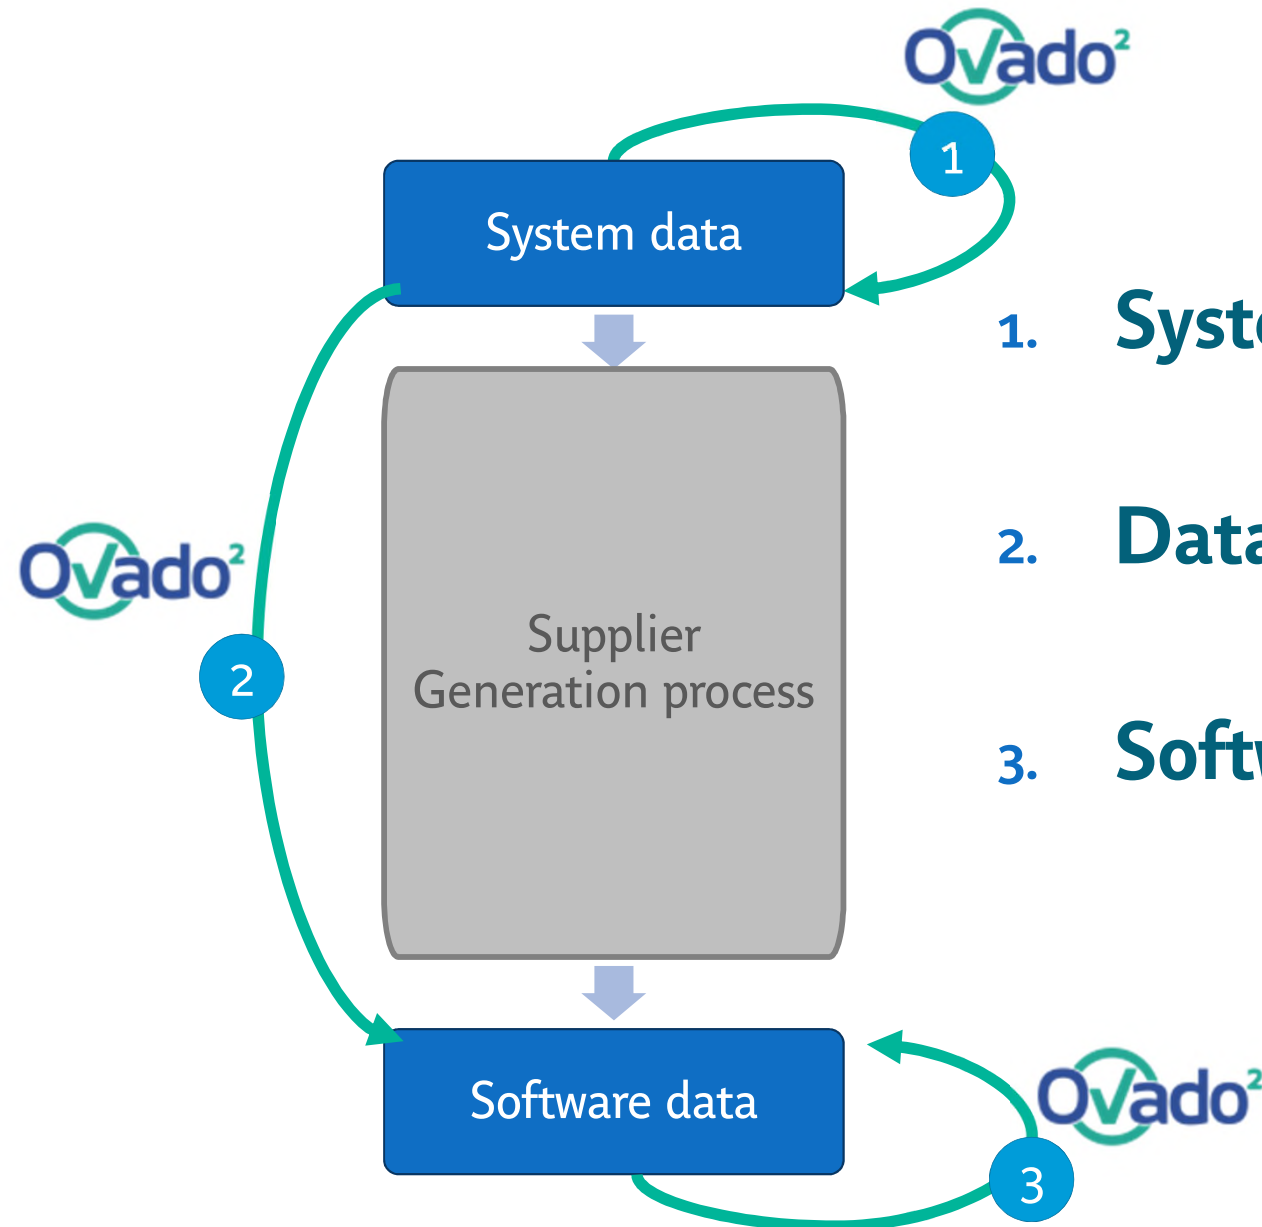

Which purpose?

SUPPLIER
PROCESS

INDEPENDENT
ASSESSMENT OF
SAFETY
CRITICAL DATA

1. **System data validation**

2. **Data transformation validation**

3. **Software data validation**

1 System data validation

⇒ Safety requirements extracted from system specification

■ Input

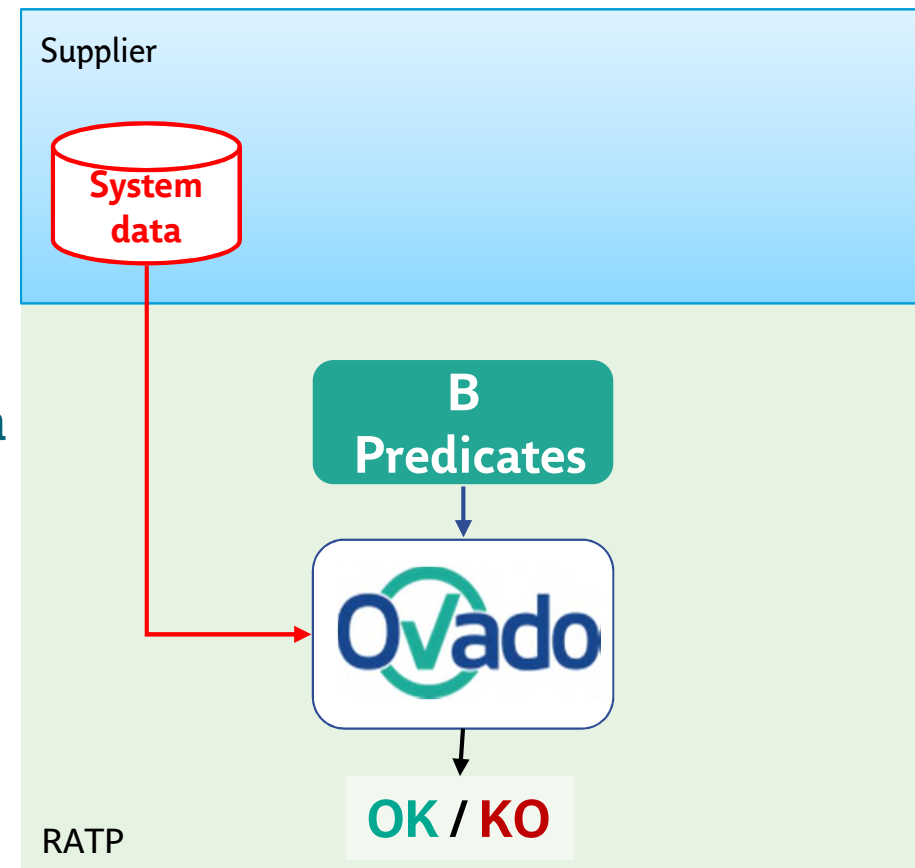

- System data specification
- Supplier system data (DB)

■ B Predicate

- Safety constraints related to system data

■ Examples

- Segment length
- Beacon spacing

1 System data validation - Examples

Segment beginning

- Segment = virtual part of the track
- The length of a track segment must be less than 2047 m,
- Number of bits allocated in the exchange message is 12

- The distance between two beacons must be more than 3 m

2 Data transformation validation

⇒ Conformity of software data with regard to system data

■ Input

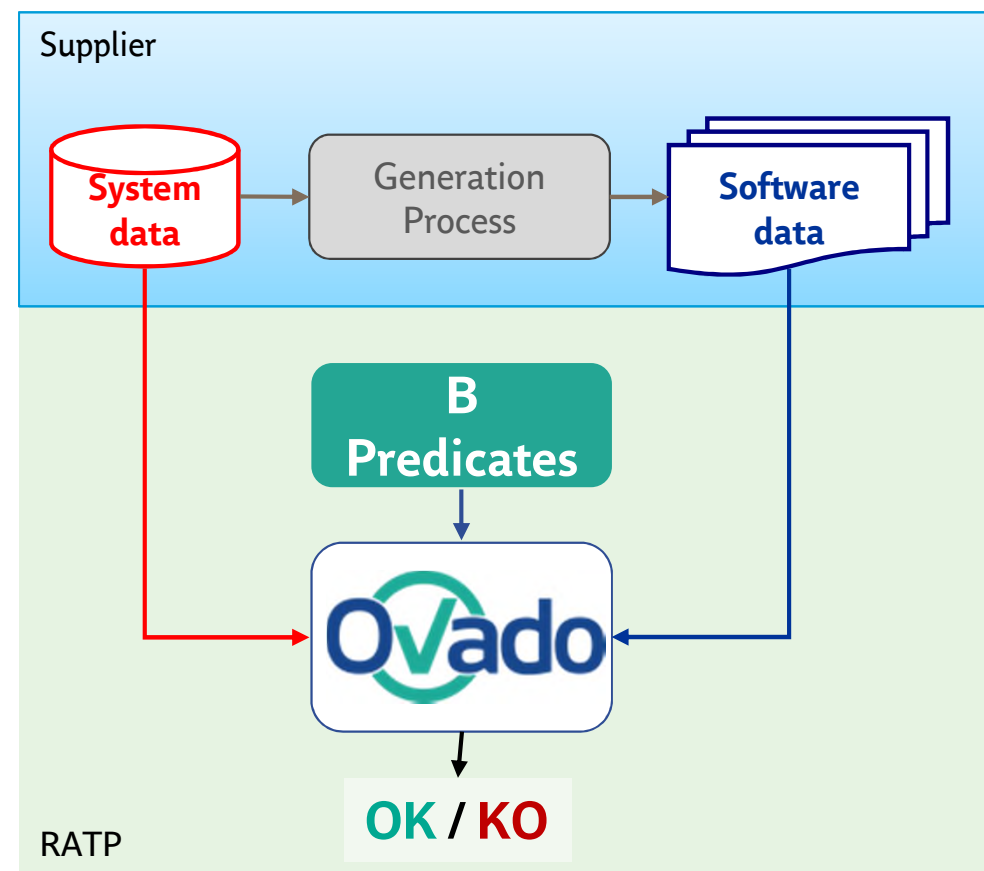

- Specification of system data
- Specification of software data
- System data
- Software data

■ B Predicate

- Transformation of software data with respect to system data
- Matching between Supplier and RATP results of transformation

■ Example

For a specific equipment
For a virtual sub-block of the track
→ Compute all the track circuits associated

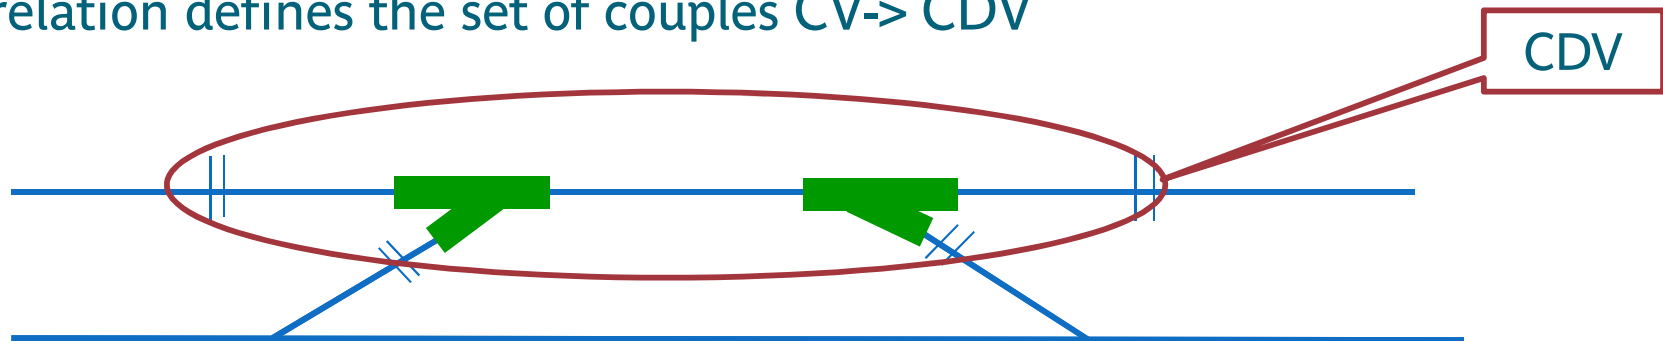

2 Data transformation validation - Example

- From the specification of invariants

- We compute the attribute of the invariant CV (virtual canton) – sub-block of the track circuit CDV

- The relation defines the set of couples CV-> CDV

- Matching

- OVADO computed invariants may have not the same order as the supplier

3 Software data validation

⇒ Safety requirements extracted from software

■ Input

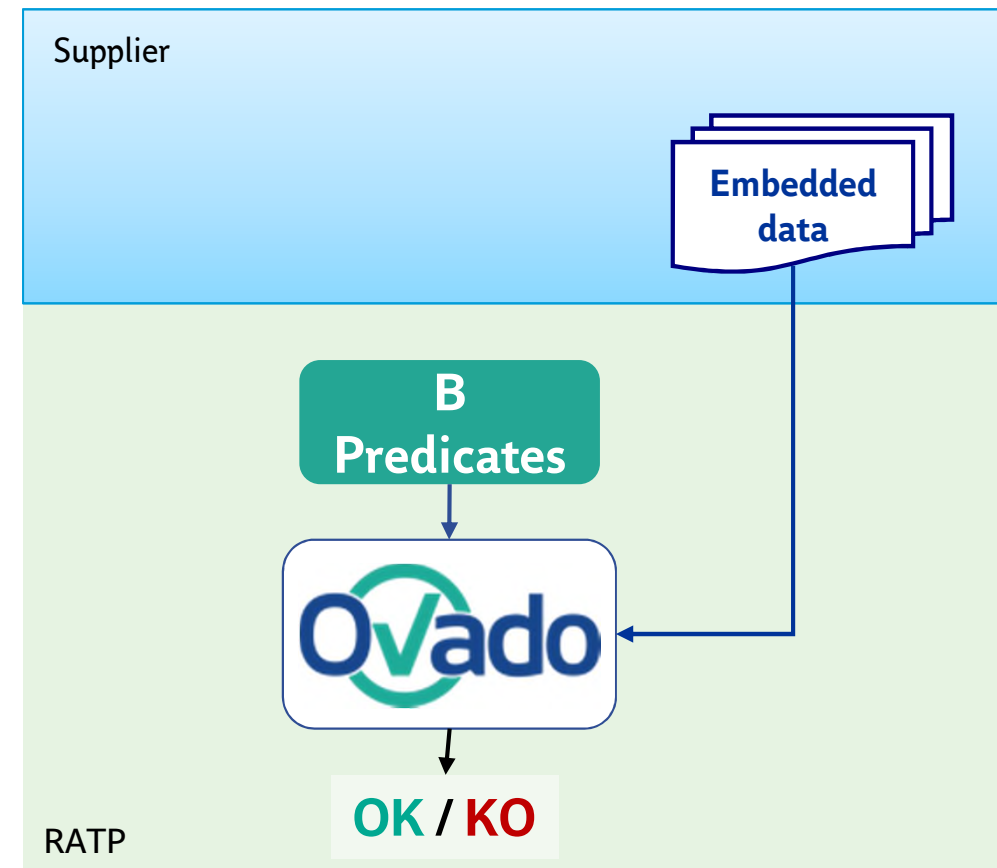

- Specification of software data
- Software data

■ B Predicate

- Constraints resulting from safety analysis or emerging from the software assessment activity

■ Example

- Number of segments under the train

3 Software data validation - Example

CHECK THE CORRECT DIMENSIONING OF A SW CONSTANT

Is the “*maximum number of segments under a train*” constant big enough for my line CBTC?

Constant = 2 for instance.

1. Write a relation R which associates all 2 possible neighbouring segments and their additional length

$$R = \{ \begin{array}{l} \{S1, S2\} \mapsto 123456, \\ \{S2, S3\} \mapsto 326548, \\ \text{etc.} \end{array} \}$$

2. Write a property to check if *longest train length is always lower than the combination of all 2 neighbouring segments length*

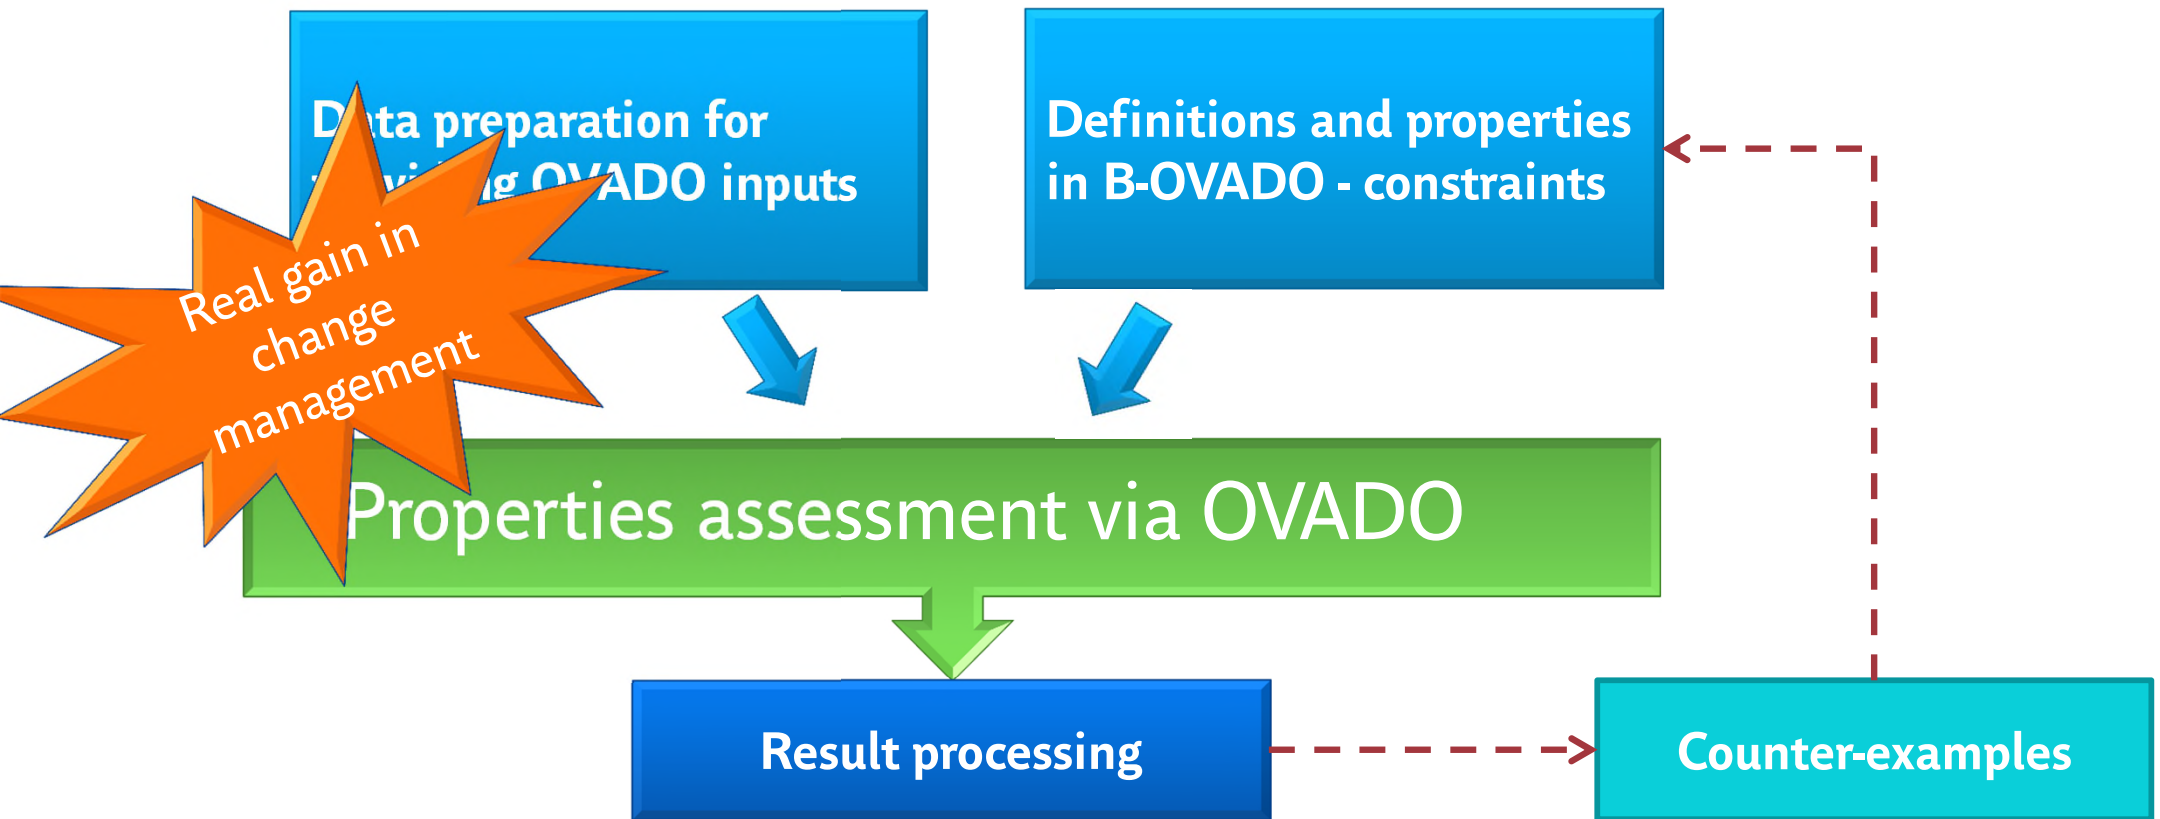

3. Evaluate property

OK: Property verified for all combinations of the CBTC data.

NOK: all improper combinations of the CBTC data will be shown

```
R = UNION (S1,S2, L1,L2).(
    S1 : E_Segments
    &
    S1 ↦ S2 : K_segment__K_neighbour_downstream
    &
    S1 ↦ L1 : K_segment__U_longueur
    &
    S2 ↦ L2 : K_segment__U_longueur
    |
    { { S1,S2 } ↦ L1 + L2 }
)
```

```
PROPERTY = ! ( S, L ).( S ↦ L : R => L_max_train_lenght < L )
```

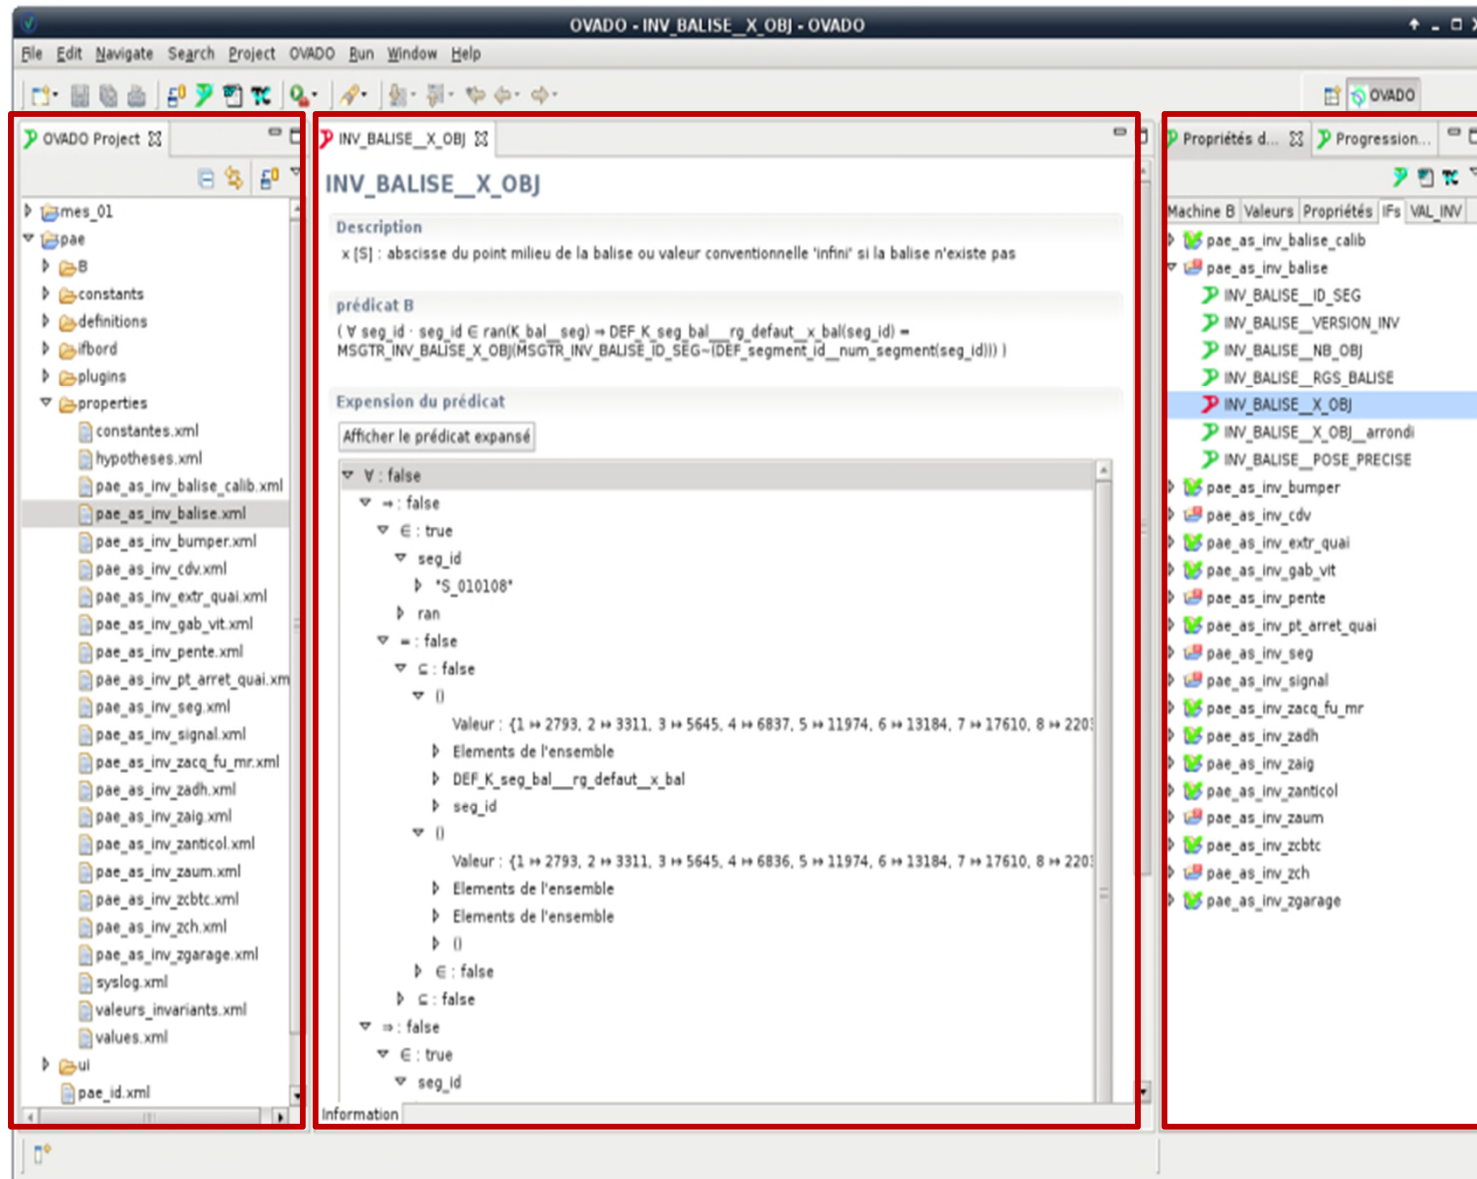

- Example : 3 Types of change in the specification of system data

- Constraints  
- Data base structure  
- Values in Data base (instance)  

Property details + counter-examples

Project tree

The screenshot displays the OVADO application window titled "OVADO - INV_BALISE_X_OBJ - OVADO". The interface is divided into three main sections:

- Project tree (left):** A hierarchical view of the project files. The "properties" folder is expanded, showing a list of XML files such as "constantes.xml", "hypotheses.xml", and "pae_as_inv_balise.xml".
- Property details (center):** The main workspace showing the details for the selected property "INV_BALISE_X_OBJ". It includes a description, a logical predicate, and its expansion. The expansion shows a complex logical expression with nested terms and values, such as "Valeur : {1 ⇨ 2793, 2 ⇨ 3311, 3 ⇨ 5645, 4 ⇨ 6837, 5 ⇨ 11974, 6 ⇨ 13184, 7 ⇨ 17610, 8 ⇨ 2205...}".
- List of properties (right):** A list of all properties in the project. The property "INV_BALISE_X_OBJ" is highlighted in blue, indicating it is the current selection.

List of properties

USE CASES

■ Data validation for CBTC

- SAET L1
- OCTYS L3, L5 & L9
- OURAGAN L13

➤ Tools migration:

- SAET L14 (in progress)
- SACEM RER A (in progress)

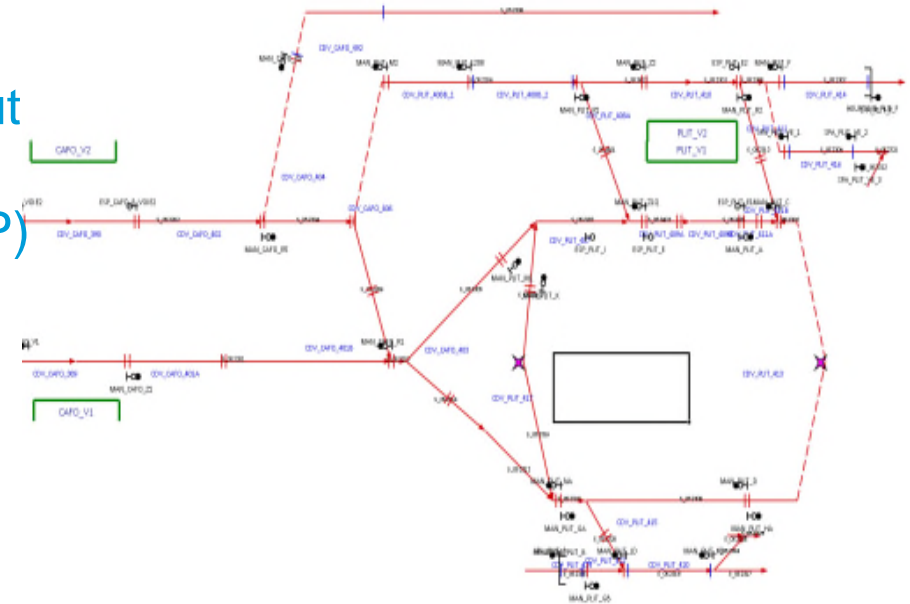

System data validation in L5

Place d'Italie – L5

From track layout
to usable data
(Supplier+ RATP)

- System data format
 - Tables & lists can be easily converted into mathematical objects

switch_name	seg_toe	seg_l_point	seg_r_point
SWITCH_PLIT_1	S2234	S2236	S2235
SWITCH_EGPA_2	S0202	S0204	S0206
SWITCH_EGPA_1	S0204	S0205	S0203
...			

Function:
I_switch_name =
{
 1 ↦ SWITCH_PLIT_1
 2 ↦ SWITCH_EGPA_2
 3 ↦ SWITCH_EGPA_3
 ...
}

Relations:
K_switch_name__K_seg =
{
 SWITCH_PLIT_1 ↦ S2234
 SWITCH_PLIT_1 ↦ S2235
 SWITCH_PLIT_1 ↦ S2236
 SWITCH_EGPA_2 ↦ S0202
 ...
}

- Functions & relations can be created with all data columns

- Compute the attribute of the invariant CV
 - The relation defines the set of couple CV-> CDV

```
/*
 *@Auteur: RATP
 *@English: INV_CV.CDV : ( cv |-> cdv ) couples in intersection.
 */
Definition INV_CV_CDV {
=
  {
=
    cv |-> cdv
=
    |
=
    cv : K_cv
=
    &
=
    cdv : K_cdv
=
    &
=
    #{zone}. {
=
      zone = intersection( K_cv_zone[{cv}] |-> K_cdv_zone[{cdv}] )
=
      &
      not( zone = {} )
=
    }
=
  }
}
```

■ Software data accepted format

- Ada
- Text
- Binaries
- XML
- Excel
- Etc.

```
INV_CV_LISTE_CDV : constant T_INV_CV_LISTE_CDV := T_INV_CV_LISTE_CDV'  
  ( 5=> -- ident CV  
    ( 1=> 1, -- ident CDV  
      OTHERS => 0),  
    6=>  
      ( 1=> 2,  
        2=> 3,  
        OTHERS=> 0),  
    7=>  
      ( 1=> 4,  
        OTHERS=> 0),  
    ...  
    OTHERS=>  
      (OTHERS=> 0)  
  )
```

■ Example

- The invariant CV has a list of CDV (at most 2)

ENHANCING DATA VALIDATION PROCESS

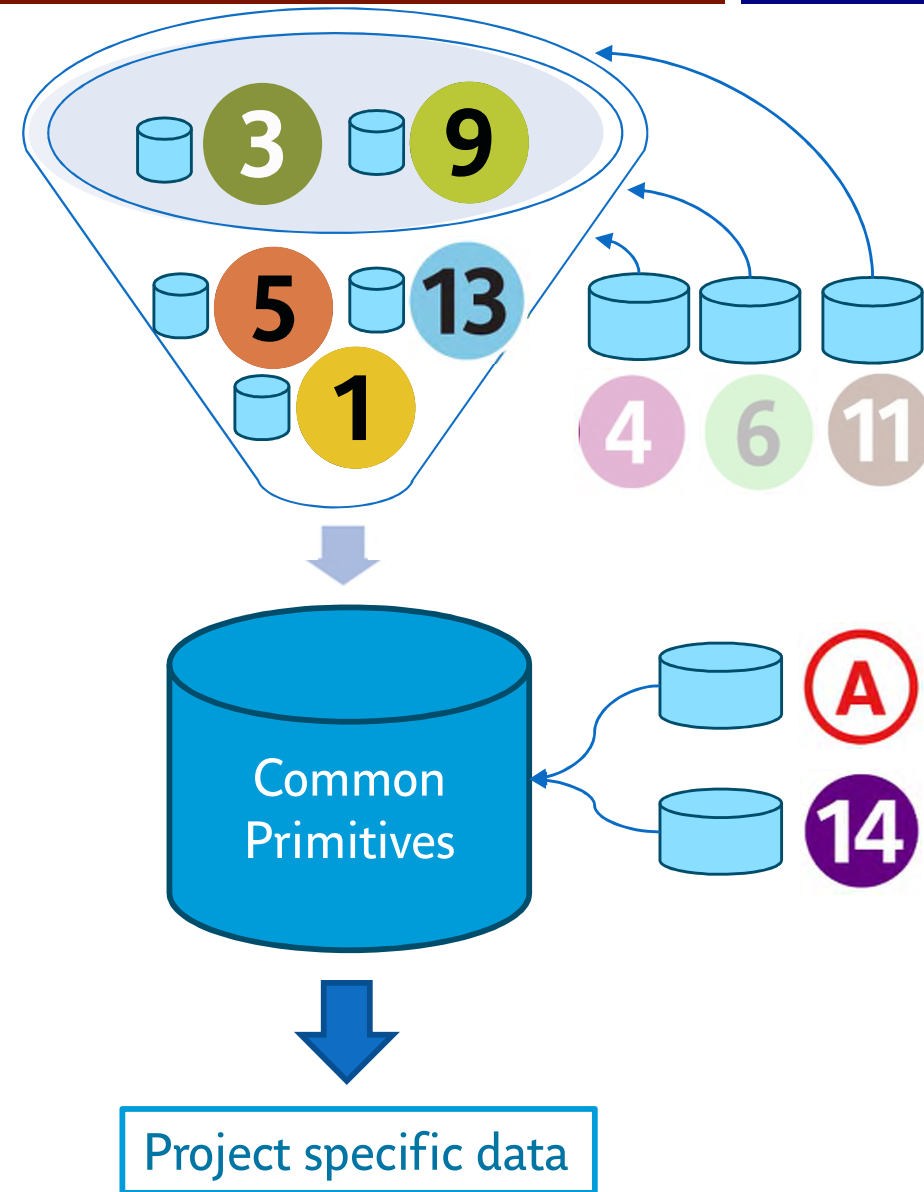

Emerging new needs

Genericity

Editor

Guidelines

- In railways (CBTC), project-related data are similar
 - Sharing elementary primitives
 - Definition of RATP Model
- Primitives data base + configuration management
 - Migration is performed for existing projects
 - Easy to use, well-documented and more safe for new projects

- Common concepts - abstraction
 - Oriented segment
 - Canonical oriented abscissa
 - Zone = area ...
- Definitions : Reusable *basic definitions* of data generic concepts
 - Area computing
 - Object abscissa on segments
 - Paths computing
 - Neighborly object relations, Etc.

■ Gain

- Properties optimization
- Change management duration

New data table : 8 hours for L 13 before common library

New data table : 2 min for L 5, L9

```
UNION(k_bal , k_seg , u_abs , e_dir , bals ).(  
  k_bal  $\mapsto$  ( k_seg  $\mapsto$  u_abs ): K_bal__K_seg__U_abs  
&  
  e_dir : E_dir  
&  
  bals =  
    UNION( $\sigma$  , x , y , k , z ).(  
       $\sigma \mapsto$  ( x  $\mapsto$  y ): zone_depuis_limite ( k_seg  $\mapsto$  e_dir  $\mapsto$  u_abs  $\mapsto$  3000 )  
&  
      k  $\mapsto$  (  $\sigma \mapsto$  z ): K_bal__K_seg__U_abs  
&  
      z : x .. y  
      |  
      { k }  
    )  
&  
    not(  
      bals <: { k_bal }  
    )  
    |  
    { bals <| K_bal__K_seg__U_abs }  
  )  
)
```

Lifecycle of OVADO Projects & effort sharing

1. L1 wayside, software data validation
2. L3 & L5 wayside, definitions and properties export
3. L5 on-board, adaptation of definitions and properties
4. **Completing all projects on-board and wayside for L1, L3, L5 & L9 with the same initial definition set**

Wayside equipment
On-board equipment

- Syntactic check (key words)
- Semantic check (typing, scoping)
- Documentation
- Auto-completion
- Navigation
- Seamless integration to OVADO

B-OVADO - Rich integrated editor 2/2

The screenshot displays the B-OVADO IDE interface. The main editor window shows a definition element `def13` with a context menu open over it. The menu includes options such as `Undo Typing`, `Save`, `Open Declaration`, `Open Generated File`, `Quick Outline`, `Cut`, `Copy`, `Paste`, `Rename Element`, `Validate`, `Quick Fix`, `Source`, `Find References`, `Add to Snippets...`, `Profile As`, `Debug As`, `Run As`, `Validate`, `Replace With`, `Acceleo`, `Force generate BOvado-XML`, `Team`, `Toggle Word Wrap`, and `Compare With`. The `Open Generated File` option is highlighted. The background shows the Package Explorer on the left, the Outline view on the right, and the Problems view at the bottom.

```

■ Formatting rules

- Naming conventions
- Indentation
- Structure, etc.

■ Example

- Easy : communication, sharing, reuse
- Applied on common library

- Properties number (#P)
#P = from 150 to **200**
 - Sanity check properties are generated automatically
 - Ex: Data base consistency
 - Ex: the object provided as a facing point of a switch is a segment
 - Number of data uploaded
 - Between 30 000 and **100 000**
 - Ex: Around 30 Mo for system data
 - Execution time
From **few seconds or minutes** to 2-3 hours (max)
 - Assessment non-regression of a new version
 - **Approximatively 1 month for a complete project** (system data, data transformation, and software data for the whole line equipments)
- **OVADO**, used for all assessments of AQL

CONCLUSION

- OVADO for safety-critical data validation
 - System data
 - Software data

- OVADO is generic and mature industrial solution
 - usable for almost all RATP CBTC data assessment projects
 - and more...

- Enhancing data validation process
 - Genericity with the common library : easy reuse, reduce time to market
 - B-OVADO rich integrated editor
 - Guidelines : improve readability, sharing , cross reading, etc.

- Extend OVADO usage to
 - Interlocking systems assessment
 - Ex: Internal validation of PHPI (Poste Hybride à Procédé Informatique)

- Extend the tool with
 - New project-specific plugins
 - Ex: integrate new data format as railML

- Enhance the functionalities provided by B-OVADO editor
 - Richer typing : semantic type control
 - Ex: Type « CDV » instead of « String »
