“Today’s funding backs scientists and innovators to collaborate on projects that will deliver a brighter, cleaner future on our roads. We are committed to ensuring that the **UK** is at the forefront of developing the battery technologies needed to achieve our aim for **all cars** and vans to be effectively **zero** emission by **2040**.” - **Nadhim Zahawi, UK Minister for Business & Industry, September 4th, 2019, Faraday Institution**

With batteries or H2 the *worst* cases of renewables + storage compare to the *best* cases of CCS.

With PHS, there is no comparison.

From a technological transitions viewpoint, growth of the energy storage sector is unavoidable.

Types of Networks

Centralized

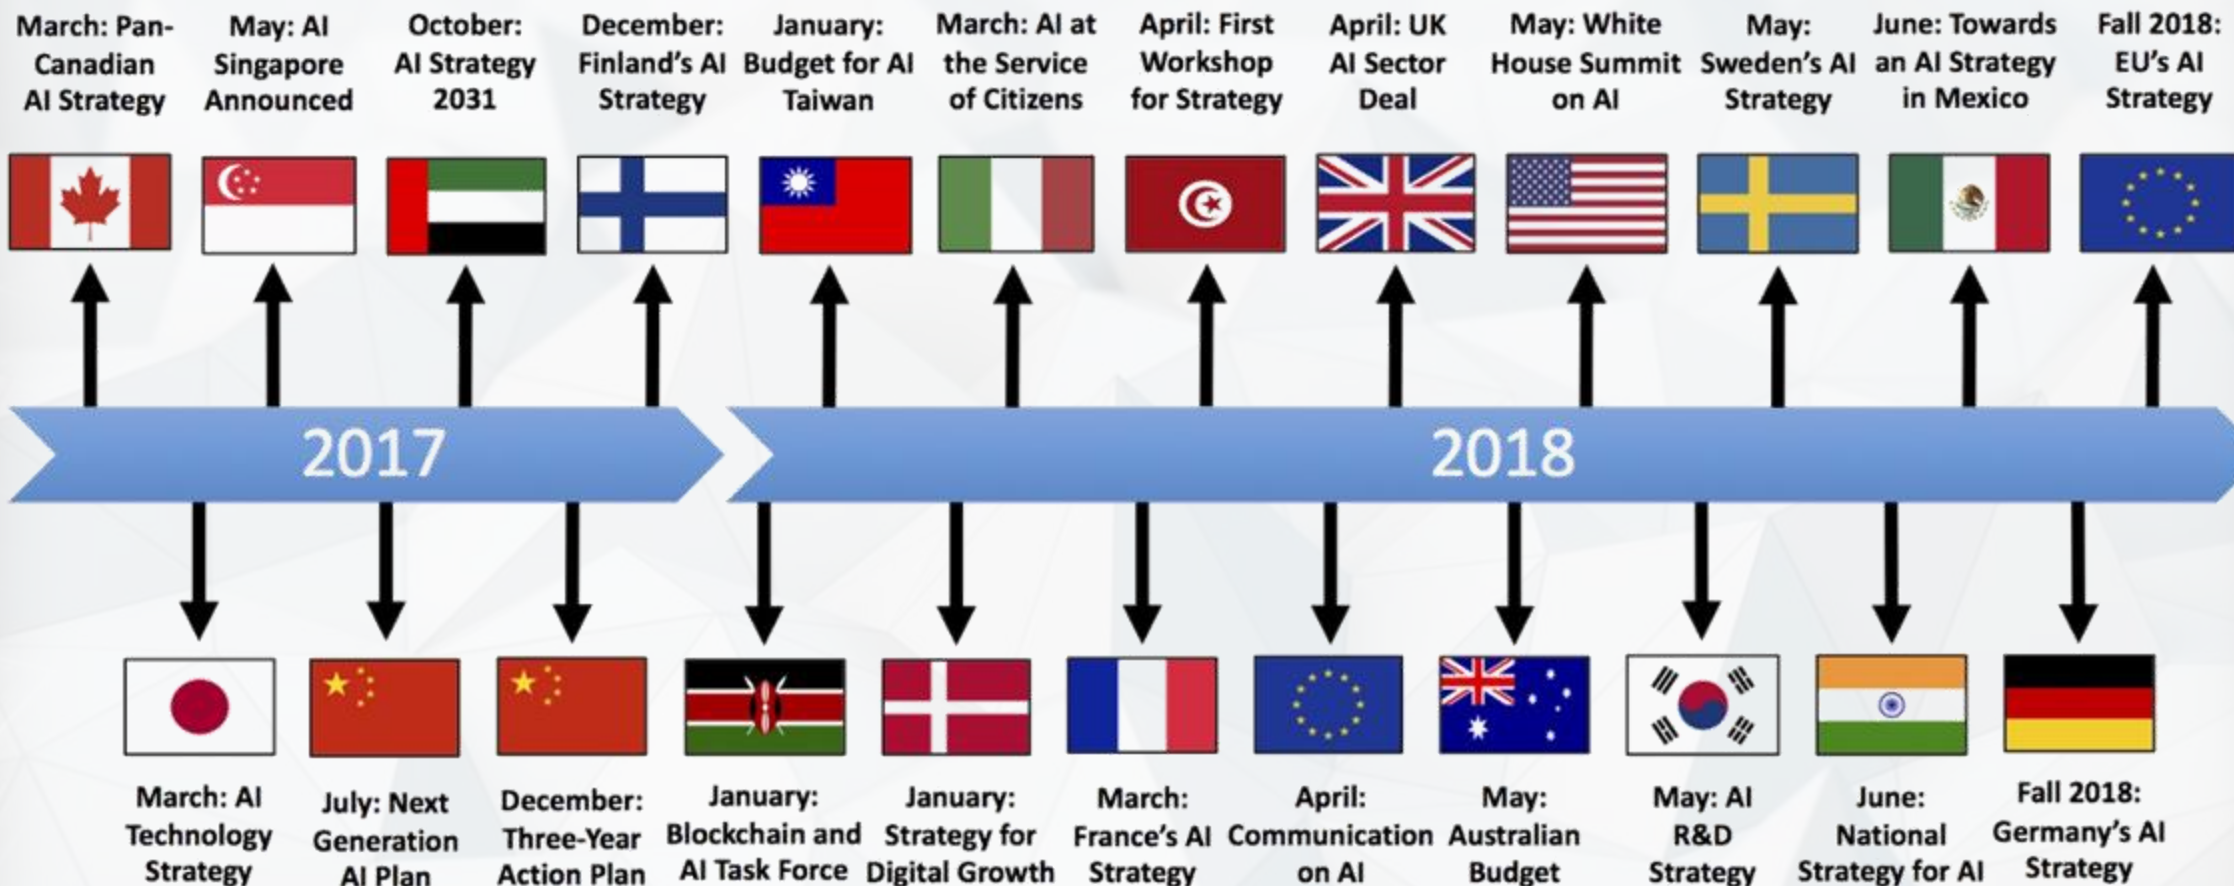

Distributed

Decentralized

2019 energy trends to watch (Forbes):

- Energy storage
- Microgrids and AI
- Blockchain and IoT

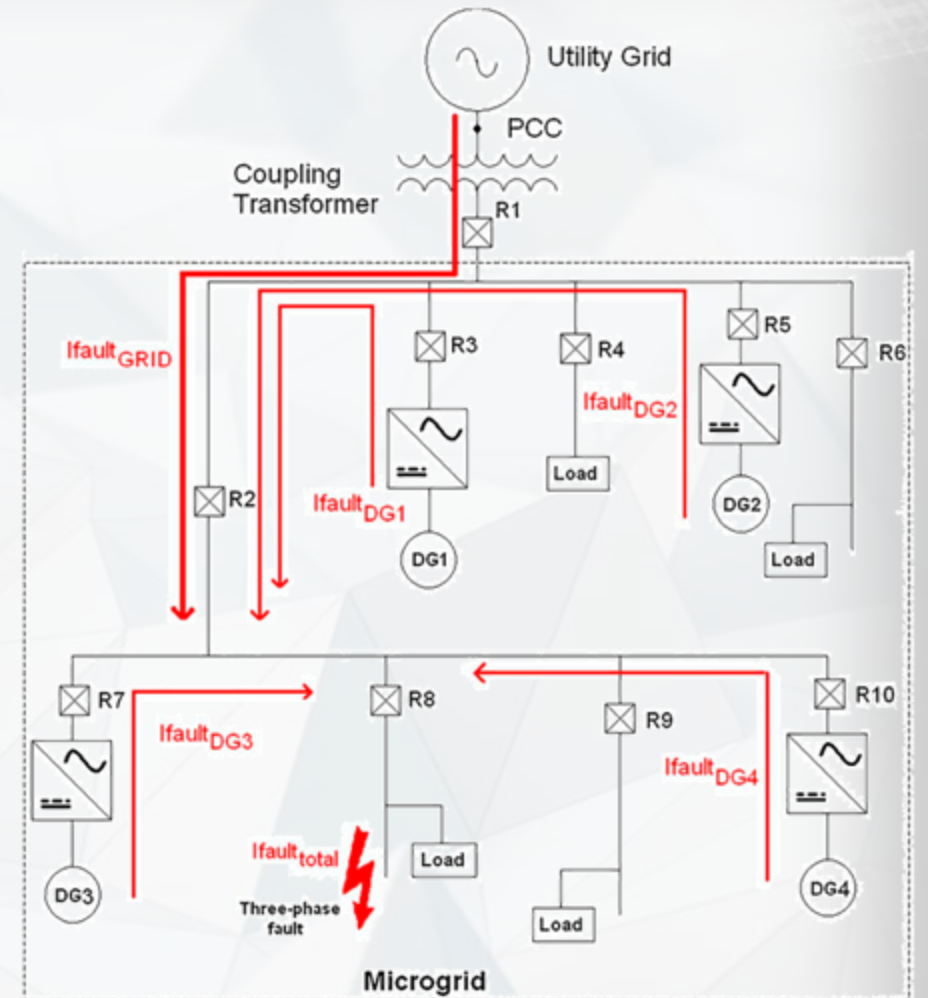

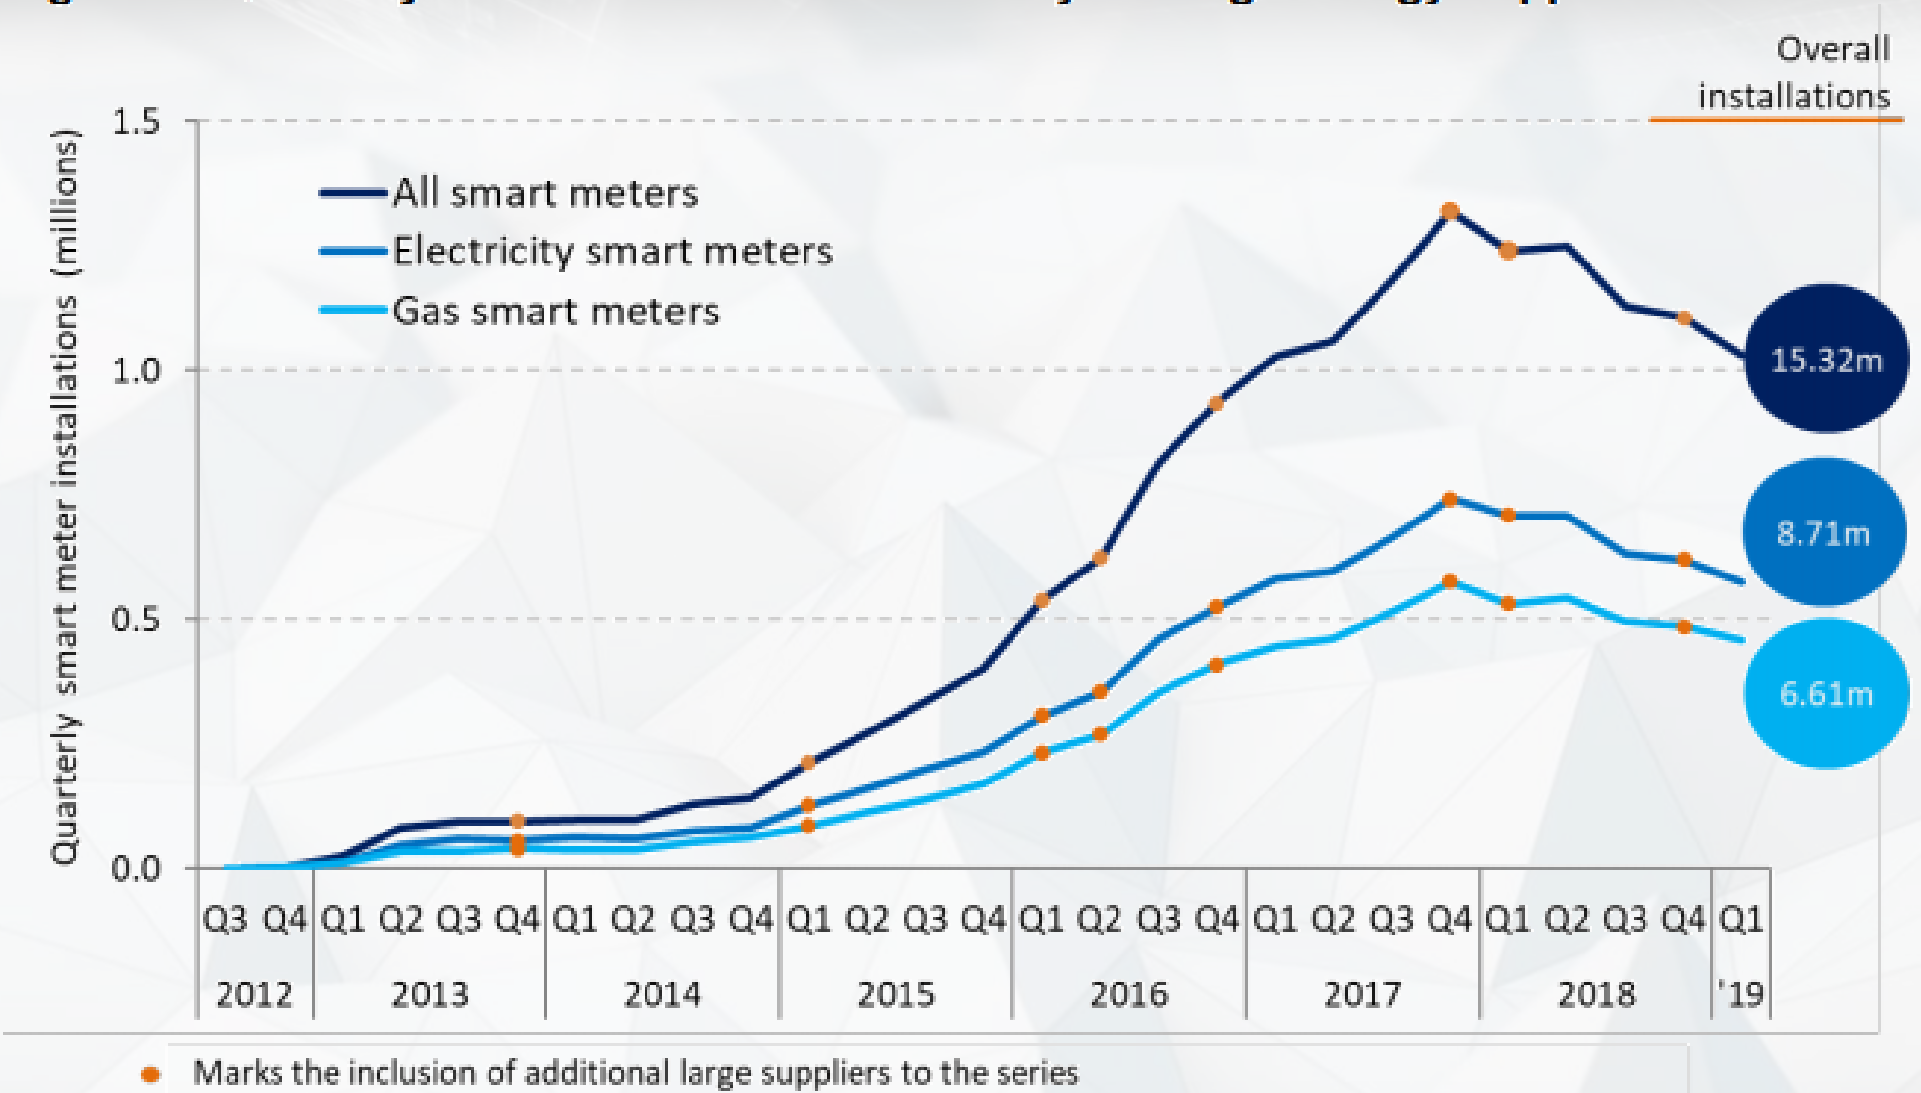

Figure 1: Quarterly domestic installation activity for large energy suppliers

BBC (2019)

“A next-generation smart grid without energy storage is like a computer without a hard drive: severely limited.”

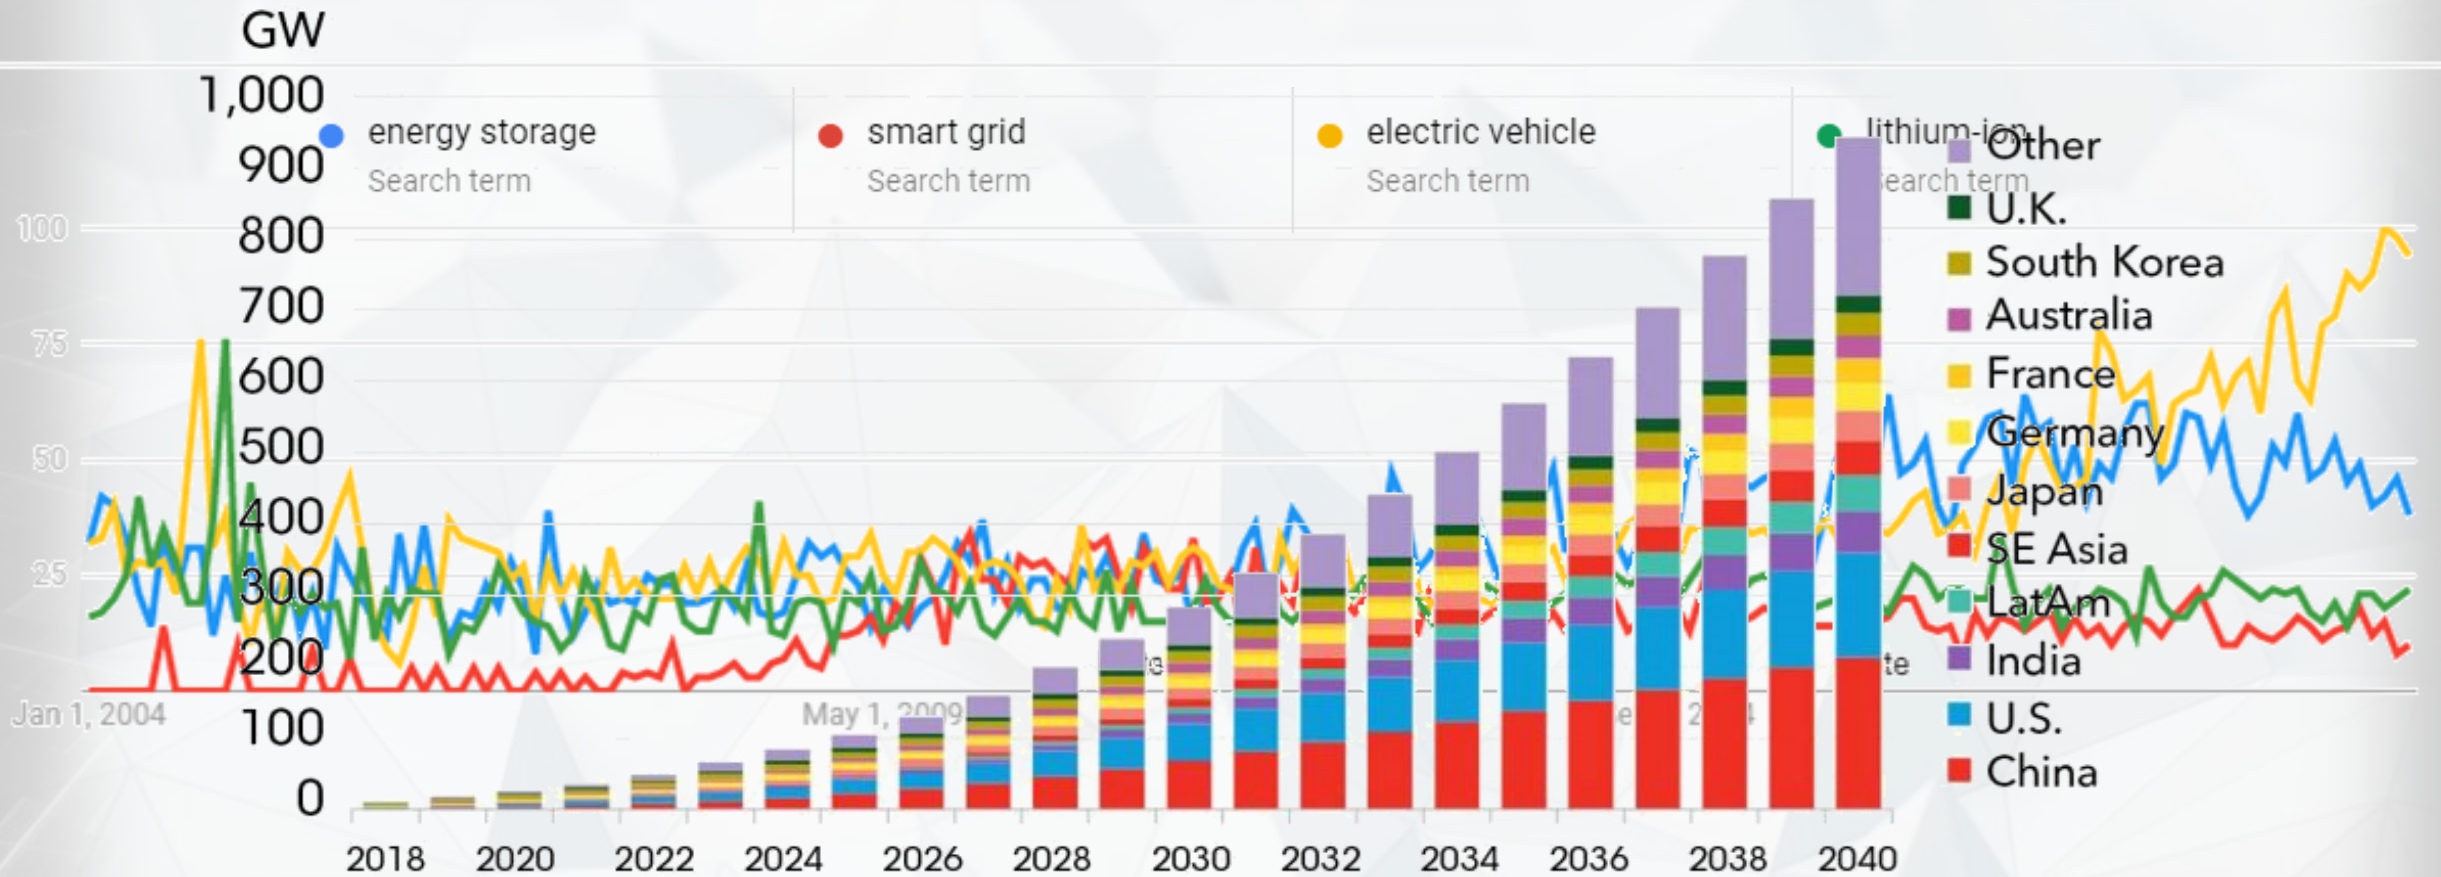

Katie Fehrenbacher, GigaOm

“With electrical interconnections talks now mentioning numbers up to 5GW, the business case for (long term) energy storage gets more and more difficult..”

Michael Pollitt, University of Cambridge
